PAO LNV for arbitrary A and B matrices

The LNV energy functional is:

$$\Omega = 3\,\mathrm{tr}[\tilde{P}\tilde{S}\tilde{P}\tilde{H}] - 2\,\mathrm{tr}[\tilde{P}\tilde{S}\tilde{P}\tilde{S}\tilde{P}\tilde{H}]$$

The tilded variables are in the smaller PAO-basis. The transformations between the larger primary basis and the PAO-basis are:

$$\tilde{P} = A^T P A \qquad \tilde{H} = B^T H B \qquad \tilde{S} = B^T S B$$

Notice that: $A^T B = B^T A = \tilde{I}$, where $\tilde{I}$ is the identity matrix in the smaller PAO basis.

The relationship between A and B is defined via the Moore-Penrose pseudo-inverse:

$$B = A(A^T A)^{-1}$$
